Claim Rejections - 35 USC § 102/103

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1-5 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Hobson et al., U.S. Pat. No. 5,445,906.

Art Unit: 1745

Rejection of claims 1-5 drawn to an energy device.

Hobson et al., teach an energy device comprising a winding body in which a band-shaped laminate (abstract) having a flexible elongated substrate, a positive collector, a solid electrolyte, a negative active material, and a negative collector in this order is wound in a plate shape with the flexible elongated substrate placed inside (col. 3, lines 37-67). The energy device according to claim 1, wherein the flexible elongated substrate is made of an insulating material (col. 6, lines 13-16). The energy device according to claim 1, further comprising a negative active material between the negative collector and the solid electrolyte (col. 3, lines 56-68). The energy device according to claim 3, wherein a thickness of the positive active material is smaller than that of the negative active material (Fig. 8, ref. 84 anode, ref. 80 cathode). The energy device according to claim 1, wherein a minimum radius of an outer surface of the flexible elongated substrate is in a range of 5 times to 100 times a thickness of the band-shaped laminate excluding the flexible elongated substrate (col. 7, lines 27-59).

Thus, the claims are anticipated.

However, if the claims are not anticipated, in the alternative, they are obvious because although Hobson et al., teach the layers in opposite order of the application, because it is well-known in the art to provide a centrally-located anode, as evidenced by Yamaura et al., U.S. Pat. No. 6,658,498. In the application of a centrally-located anode, the thickness of the anode would be smaller than the cathode.
